FEATURES

- Automatic License Plate Recognition (ALPR) with GMS

- Quick, reliable, and cost-effective user verification system

- Control access to parking area facility, based on programmed privileges

- Send notifications on detection of unauthorized number plates

- Minimize wait times at access points

- Support unlimited number of vehicles and access points

- Fast license plate authentication

- Easy installation and configuration

- All access information captured in standard GMS logs and reports

- Customise rules for various entry access points

- Link 5 license plates to each cardholder

PACOM GMS Vehicle Access Control (VAC) works with ALPR cameras to provide hands free automated access control for secure parking sites using license plates.

When a vehicle approaches, the ALPR camera captures the license plate text and sends it to GMS for verification. MS checks the associated cardholder credentials and opens the parking gate for authorized license plates.

Removing the need for cardholders to stop and swipe their card:
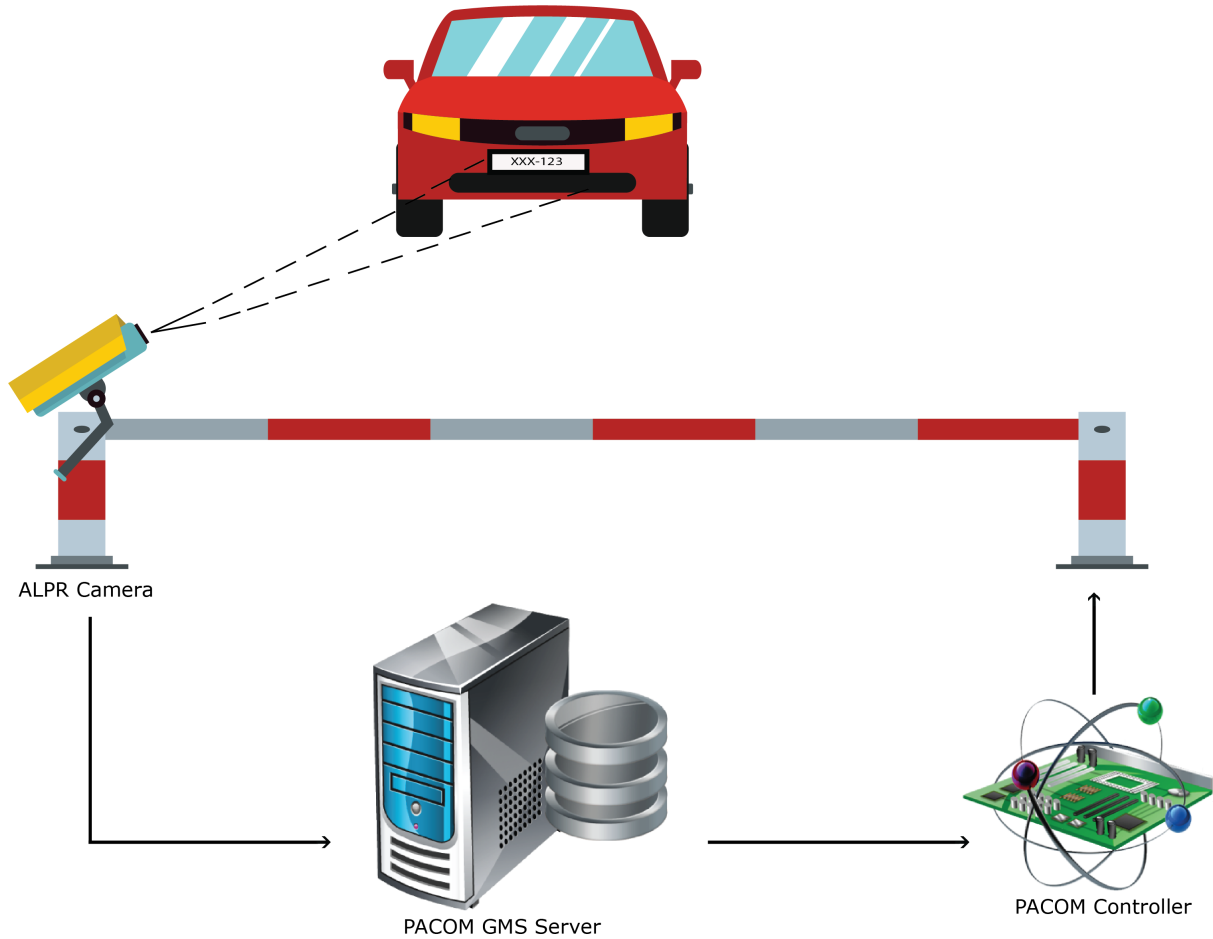

- streamlines traffic flow
- minimizes wait times
- provides a cost-effective solution, that requires no additional equipment.

VAC makes it possible for GMS operators to:

- respond to unauthorized attempts to access secure parking sites
- monitor single or multiple sites using customized alerts and notifications
- generate reports and muster information based on license plates and entry/exit dates and times
- manually enter license plates should ALPR recognition fail.

PACOM GMS is the perfect multi-site security management platform, providing integration between access control, intrusion, video, intercom and virtually any building management or security solution.
